Tool Search: Resync State Data

The Resync State Data - Selective Sync tool allows system administrators to manually sync Person/Identity and Enrollment records for a specific set of users. This tool provides an easy way to correct data discrepancies found between state and district databases while producing minimal performance impact. This tool works the same for both State and District users. Records are identified by district personIDs (when syncing Person Identity) or district enrollment IDs (when syncing for Enrollment).

How-to guides

- Manually sync objects for specific users
- View the sync history
- Correct record sync failures
- Find ID fields for syncing data
- Analyze data inconsistencies between the District and State
